PATIENT IMPROVEMENT

Mean Improvement

The blue graph to the right represents the average of the last reported Percent Improvement score for each patient. N = 31 for SCP and 104 for Stem Cell.

Average Percent Improvement

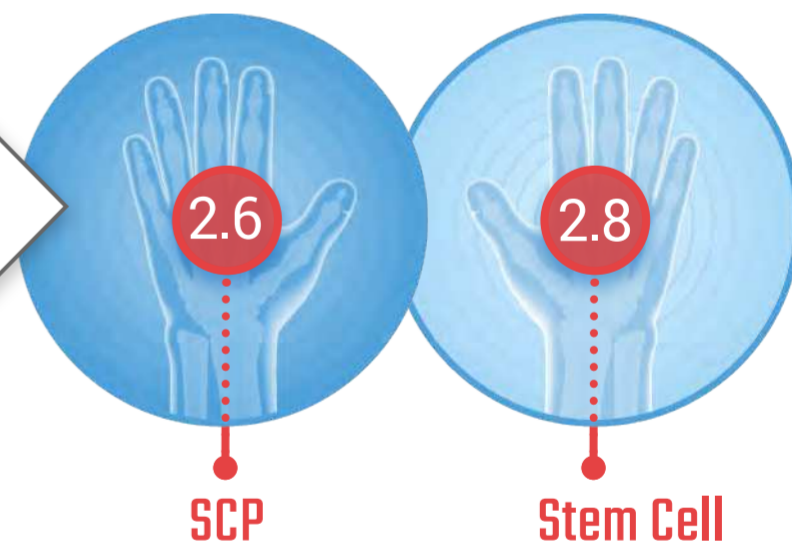

Average Pain Scores

Differences In Pain Scores

Average Pain

The blue graph to the left represents the average pain scores for patients pre-op and at their last reported time point. N = 28 for SCP pre- and post-op, 86 for Stem Cell pre-op, and 96 for Stem Cell post-op. The graph above represents the average differential in pain between pre-op and last reported time point. N = 28 for SCP and 73 for Stem Cell.

The Regenexx-SD procedure is a same day bone marrow Stem Cell procedure that isolates the fractions of bone marrow that have the most Stem Cells.

Patients receiving same day Stem Cell procedures generally had more severe arthritis and a more progressed disease state than those receiving SCP procedures. **All SCP procedures were for the CMC joint.**

About This Data

This data analysis is part of the 2015 download of patient results tracked in our advanced treatment registry.

Caution!

This is registry data, which is not the same as a drug company style controlled trial.

The Regenexx® Procedures are the nation's most advanced non-surgical stem cell and blood platelet treatments for common injuries and degenerative joint conditions, such as osteoarthritis and avascular necrosis.

These stem cell procedures utilize a patient's own stem cells or blood platelets to help heal damaged tissues, tendons, ligaments, cartilage, spinal disc, or bone.
